

A cloud of highly configurable blowing leaves.

Load the example `Blowing_Leaves_Keyframed.unity` scene for an example of the keyframed leaves, or `Blowing_Leaves_Particles.unity` for an example of the particle leaves (note that the demo scenes are only for the built-in render pipeline). Alternatively, simply drag the required prefab into your scene.

To change the settings of the keyframed effect, select the particle effect in the Hierarchy window (on the left), and then you'll see the various parameters in the Inspector window (on the right). You'll notice an arrow in the Scene view that indicates the wind direction (you'll want to hide this with a camera culling mask or simply untick it in the inspector - this is already set up in the example scene); to change its direction, make sure you rotate the parent `GameObject` (ie `BlowingLeaves_Keyframed_Small`) and not this indication arrow.

With the particle effect, make sure that your scene's ground plane is set up with the 3 child particle systems (`Blowing_Leaves_A`, `Blowing_Leaves_B`, `Blowing_Leaves_C`); select a particle system in the Hierarchy window (click the small grey triangle on the particle system in the Hierarchy window to make these children visible), then in the Inspector window, scroll down and expand out the Collision section. Then drag your scene's ground plane from the Hierarchy window into the slot to the right of where it says "Planes". Note this has already been set up in the example scene.

Have fun!
